

SEREN

Every child is a star.

Prepared for the SEREN Founding Team

Founder: Sanskardeep Talikote
Confidential Internal Document

1. WHAT WE ARE BUILDING

SEREN, In One Page

SEREN is a mobile app. You open it, spend a few minutes on some simple games and small tasks on your phone, and the app quietly figures out if you or your child is dealing with a hidden difficulty — something like struggling to read, poor handwriting, weak concentration, stammering, social anxiety, or low self-confidence. No special equipment, no clinic visit, no expensive doctor appointment is needed to get this first check done. All of it happens on an ordinary phone.

Once SEREN identifies what someone is struggling with, it does not stop at just giving a result. It also becomes a daily 10-15 minute coach — with exercises and practice built specifically for that person's difficulty — so the problem is actually worked on, not just labelled and forgotten.

In short: SEREN finds the problem early, explains it in plain language to the child, parent, or adult, and then gives them a practical, daily way to improve. That is the entire idea.

Why this is such a big deal

In India, out of every 100 school children, roughly 10 to 12 are quietly struggling with something like this — and almost none of them are ever identified in time. These are not children with low intelligence. They are often bright, capable children who are simply never checked properly. The problem does not go away when they grow up either — it follows them straight into college and their careers, just better hidden.

2. WHY THIS MATTERS

The Real Reason SEREN Exists

Numbers and statistics are easy to skip past. So before anything else, every person joining SEREN should understand this problem through two very real, very human examples.

The Confident Voice That Was Never Given a Chance

A Teacher, Even Today, Still Carrying It

One of our own college professors — someone well past 45, respected, experienced, and clearly knowledgeable — still struggles every single time he has to stand up and speak in front of a class. He stammers. Not because he does not know the subject, but because of a speech difficulty that was never identified or worked on when he was a child. Decades later, it is still quietly affecting his confidence, in front of students half his age, every single day.

This is exactly the kind of case SEREN is built for. If a tool like SEREN had existed when he was a child, this could have been identified and worked on early — and he could be living and teaching today with the full confidence his knowledge already deserves. The good news is that it is genuinely not too late even now. This is precisely the kind of case our adult program is designed to help — later than ideal, but still very much possible.

The Child Nobody Noticed

A Story Many of Us Already Know

Most people in India have seen the film *Taare Zameen Par* — the story of a young boy who is constantly scolded, mislabelled as careless or lazy, and made to feel like a failure at school, when in reality he simply has dyslexia and processes letters and words differently. Nobody around him — not his teachers, not his parents — recognises this, until one adult finally notices and helps him.

That story struck a chord with an entire country because it is not fiction for millions of Indian children — it is their exact daily reality, playing out quietly in classrooms across the country, right now. SEREN exists so that this recognition does not have to depend on one lucky teacher noticing one lucky child. It happens automatically, early, and at scale, for every child who has access to the app.

Every person working on SEREN should keep these two examples in mind. We are not building "another education app." We are building the thing that could have changed the entire life path of people like these — and will, for millions of others, going forward.

3. THE SCALE OF THE OPPORTUNITY

This Is Not a Small Problem

Before talking about product or revenue, everyone pitching SEREN needs to be able to say, with total confidence, exactly how big this problem is. The numbers below are conservative, published estimates — not projections we have invented.

Metric	Figure	What It Means
India's school-age population	Approximately 250 million children	The largest single school-age population of any country in the world.
Children with at least one undetected condition	10% – 12% of all school children	Tens of millions of Indian children right now, in classrooms, undiagnosed.
Adults carrying the same conditions, unaddressed	Tens of millions	Childhood conditions like dyslexia, ADHD, and stammering do not disappear at graduation.
Government policy backing	NEP 2020, mandatory nationwide	Every school in India — private and government — is now required to screen for this.

Put simply: this is a nationwide, government-mandated requirement with no dominant, affordable, at-scale solution currently serving it. That combination — a massive, proven need plus a policy that forces the market to act — is exactly the kind of opening that turns a good idea into a category-defining company. SEREN is built to be the company that fills that gap first.

4. WHAT SEREN SCREENS FOR

The Full Picture — 80+ Conditions, Eight Categories

This is the part that makes SEREN different from a single-purpose app. It does not screen for just one difficulty. It screens for 80+ conditions across eight categories, covering the full range of learning, attention, speech, emotional, sensory, and confidence-based difficulties that affect children, teenagers, and adults. Every person pitching SEREN should be able to open to this page and show, in one glance, just how wide this net actually is.

Category	Conditions Included
1. Learning Disorders 9 conditions	Dyslexia • Dyscalculia • Dysgraphia • Dyspraxia / DCD • Irlen Syndrome / Visual Stress • Non-Verbal Learning Disability (NVLD) • Reading Fluency Lag • Orthographic Processing Deficit • Undiagnosed Adult Dyslexia
2. Attention & Processing 9 conditions	ADHD – Inattentive Type • ADHD – Hyperactive/Impulsive Type • ADHD – Combined Type • Auditory Processing Disorder • Processing Speed Disorder • Working Memory Deficit • Time-Blindness • Executive Function Deficit • Undiagnosed Adult ADHD (Masked)
3. Speech & Language 10 conditions	Stuttering • Word-Finding Difficulty (Anomia) • Expressive Language Disorder • Receptive Language Disorder • Social Communication Disorder • Childhood Apraxia of Speech • Phonological Disorder • Cluttering • Voice Disorder (Dysphonia) • Accent-Related Communication Anxiety
4. Anxiety Disorders 11 conditions	Generalised Anxiety Disorder • Social Anxiety Disorder • Selective Mutism • Exam / Test Anxiety • Separation Anxiety Disorder • School Refusal • Specific Phobia • Panic Disorder • Performance Anxiety • Illness-Related Health Anxiety (Child) • Health Anxiety (Adult)
5. Emotional & Behavioural 10 conditions	Childhood Depression (Masked) • Emotional Dysregulation • Oppositional Anxiety-Driven Behaviour • Adolescent Depression • Adjustment Disorder • Post-Disruption Learning-Loss Anxiety • Burnout Syndrome (Adult) • Parental Burnout • Trauma-Based Silence • Grief-Related Withdrawal
6. Silent Profiles & Neurodiversity 11 conditions	Masking and Camouflaging • High-Functioning Autism (Masked) • Social Communication Disorder (isolated) • Twice-Exceptional Profile (2e) • Pathological Demand Avoidance • Gifted Underachievement • Introversion-Driven Academic Suppression • Invisible Struggle (Composite Burden) • Alexithymia • Highly Sensitive Person Overwhelm • Chronic People-Pleasing / Fawn Response
7. Sensory & Motor 4 conditions	Sensory Processing Disorder • Sensory Defensiveness • Vestibular Processing Difficulty • Proprioceptive Processing Difficulty
8. Insecurities & Confidence Deficits 21 conditions	Body Image Insecurity • Imposter Syndrome • Rejection Sensitivity • Workplace / Career Insecurity • Relationship Insecurity • FOMO / Social Comparison Anxiety • Digital / Online Social Insecurity • Academic Trauma • Stuttering-Linked Confidence Deficit • Decision Paralysis • Financial Confidence Insecurity • Leadership Avoidance Pattern • Career-Stagnation Confidence Collapse • Shyness (Deep-Rooted) • Voice and Expression Insecurity • Social Belonging Insecurity • Performance / Achievement Insecurity • Anger as Hidden Insecurity • Family-Origin Insecurities • Perfectionism-Driven Self-Criticism • Public Speaking Phobia

This is also why SEREN cannot be dismissed as "just another dyslexia app" or "just another anxiety app." It is a single screening layer built to catch the entire spectrum of hidden difficulties — from a seven-year-old who reverses letters, to a teenager who cannot say no to peer pressure, to a working adult who has quietly built an

entire career around avoiding public speaking.

5. OUR MARKET

Who SEREN Serves — B2B and B2C

SEREN is built to serve two different kinds of customers at the same time. This is important for everyone on the team to understand clearly, because it directly shapes the product roadmap and the revenue plan explained later in this document.

Business Type	Who They Are	What SEREN Gives Them
B2B (Business-to-Business)	Schools (private and government) and NGOs working in education and child development.	A screening and reporting tool the school or NGO uses across all its students, plus a simple dashboard for teachers to understand which children need extra attention and why.
B2C (Business-to-Consumer)	Individual parents, and any adult who wants to check and improve themselves.	A direct app they can download themselves — to screen their child or themselves, understand the result in plain language, and follow a personal, daily improvement plan.

These two sides are connected, not separate. A school uses SEREN on all its students (B2B). If a child's report shows they need deeper, more personal attention, their parents are guided to download the individual SEREN app and pay for a focused treatment plan for that child (B2C). This is one of SEREN's biggest strengths — the B2B side naturally creates B2C customers.

How It Works, In Plain Terms

Step	What Happens
1. Screen	The person spends a few minutes on simple, game-like tasks on their phone. No special hardware, no lab visit.
2. Report	SEREN generates an easy-to-understand report — no confusing medical jargon — explaining exactly what area needs attention and why.
3. Act	Based on the report, the person (or their parent) gets a short daily practice routine built specifically to work on that exact difficulty.

6. OUR ROADMAP

The Five Phases of SEREN

SEREN is being built step by step, in five clear phases. Every person on the team should know exactly which phase we are in right now, and what comes next.

PHASE 1	Foundation & Research	COMPLETED
This is everything that needs to happen before a single line of the product gets built. It has already been fully completed. This included: identifying exactly which conditions SEREN would screen for and why they matter, studying the scale of the problem in India and globally, researching every target user group in detail — children, parents, schools, NGOs, and adults — and confirming that SEREN's approach lines up directly with the Government of India's National Education Policy (NEP) 2020, which now requires schools to identify and support children with learning difficulties. All of the groundwork — the "why," the "who," and the "how it fits into the real world" — is done.		
PHASE 2	Build the Individual App	IN PROGRESS — CURRENT PHASE
This is where we are right now. We are building the first version of SEREN as an app for individual use — something a parent or an adult can download directly and use on their own, without needing a school involved at all. This version is being kept focused: it needs to work well for a smaller, clearly defined set of the most common and best-understood difficulties first, rather than trying to cover everything at once.		
PHASE 3	Turn It Into a School Product (SaaS)	NEXT
Once the individual app is working well and proven with real users, the same underlying technology gets rebuilt into a version designed for schools to use across their entire student body — with bulk screening, a teacher dashboard, and simple reports schools can act on. This is what turns SEREN from a single app into a subscription product (SaaS) that schools pay for on an ongoing basis.		
PHASE 4	Pilot Testing With Real Schools and NGOs	PLANNED
Before selling this widely, SEREN gets tested for real, in at least 10 or more actual schools and NGOs. This is where we collect genuine, real-world results — not just lab numbers — and use them to fix problems, sharpen accuracy claims, and build the kind of proof that makes schools, investors, and government officials trust the product.		
PHASE 5	Government Contracts, District by District	PLANNED
This is the big scale-up stage. India's NEP 2020 policy now makes child psychological screening compulsory in schools. SEREN is positioned to be the tool that helps the government fulfil this requirement. In this phase, we sign contracts directly with district-level government officials — District Collectors, District Education Officers, and District Health Officers — to deploy SEREN across all government schools in that district, on a paid, per-child basis.		

7. HOW WE MAKE MONEY

The Business Model

SEREN earns money in three connected ways. Understanding all three — and how they feed into each other — is essential for every founding member to understand cold.

A. Schools (B2B) — Powered by a Government Mandate

Under NEP 2020, child psychological screening has now been made compulsory for schools across India. This is not something SEREN needs to convince schools to want — it is something they are now required to do. SEREN positions itself as the tool that lets schools fulfil this requirement easily and affordably, instead of setting up their own expensive process.

Each school using SEREN charges its students a small monthly amount — roughly Rs. 50 to Rs. 100 per child per month — for the screening and the report it produces. In return, every child gets a proper report, and the school can then give that specific child the right kind of personal attention, instead of treating every student the same way.

Here is the part that matters most for how schools will actually respond to us: this amount is split 50/50, every month. Half goes to SEREN as the technology and screening partner. The other half stays with the school. This is deliberate. A school that is only asked to "comply" with a mandate has no real reason to promote it or make it work well. A school that earns a direct, ongoing, recurring share of the revenue has a genuine financial reason to actively partner with us — to encourage every parent to opt in, to make screening day a smooth and well-run event, and to keep renewing every year. It turns schools from a compliance checkbox into a motivated distribution partner.

B. Individuals (B2C) — Direct Self-Improvement

Any adult — regardless of whether they came through a school or not — can download the SEREN app directly, test themselves, and get a personal improvement plan. For this, the individual pays roughly Rs. 200 to Rs. 300 per month for ongoing, personalised treatment and practice sessions.

C. The Bridge Between B2B and B2C

This is where the two models reinforce each other. When a child's school report shows they need more focused help than a classroom setting alone can give, their parents are the ones who decide they want deeper support. At that point, they download the individual SEREN app specifically for their child and pay for a personal treatment plan. In other words, every school we sign up does not just generate B2B revenue — it also generates a steady, natural stream of B2C customers.

D. Government Contracts — The Largest Scale Opportunity

For government schools specifically, SEREN does not sell school-by-school. Instead, contracts are signed directly with district-level government officials — District Collectors, District Education Officers, and District Health Officers — to deploy SEREN across every government school in that district at once. This is charged as a fixed amount per child per month, and it is directly justified by the fact that NEP 2020 has made this kind of screening mandatory for all schools in the country, including government ones.

Revenue Source	Who Pays	Rate	Split	Why They Pay
Schools (B2B)	Private and government schools, on behalf of enrolled students	Rs. 50 – Rs. 100 per child / month	50% SEREN 50% School	Fulfills the NEP 2020 mandatory screening requirement, and the school earns an ongoing revenue share
Individuals (B2C)	Any adult, self-paying	Rs. 200 – Rs. 300 per month	100% SEREN	Personal self-screening and a treatment plan for their own growth
Parent Upgrade Path	Parents of a flagged child, after a school report	Rs. 200 – Rs. 300 per month	100% SEREN	Deeper, personalised treatment for their own child
Government Contracts	District Collectors, Education Officers, Health Officers	Fixed rate per child / month	Per contract terms	District-wide compliance with NEP 2020 across all government schools

What This Looks Like in Real Numbers

It helps to see this as real numbers instead of abstract percentages. Below is a simple, conservative illustration — not a promise, just a way to see how quickly this adds up once even a modest number of schools are on board.

Scenario	Assumption	SEREN's Monthly Share (Illustrative)
Early school traction	50 schools x 400 students x Rs. 75/month average screening fee = Rs. 15,00,000/month total collected, split 50/50	Roughly Rs. 7,50,000 / month to SEREN, from screening alone
Parent upgrade layer	Even a modest 8% of screened children upgrade to individual treatment at Rs. 250/month	An additional, largely passive revenue stream on top of SEREN's school-side share
One government district	A single district can have 1,000+ government schools under the NEP mandate	A single signed district contract can rival the combined revenue of hundreds of private schools

This is exactly the kind of math that should be walked through, out loud, with anyone being pitched on SEREN — because it shows the model is not dependent on going viral or capturing a niche audience. It scales in direct proportion to how many schools and districts adopt something they are already required to have.

8. OUR EDGE

Why SEREN, and Why Not Someone Else

Anyone pitching SEREN should be ready to answer the obvious question: what stops a school, an NGO, or the government from simply using something else, or doing this the old way? Here is the honest answer, point by point.

Advantage	Why It Matters
One tool, dozens of conditions	Screens for learning, attention, speech, anxiety, and confidence difficulties in a single session — instead of needing a separate specialist or test for each one, which is slow, expensive, and simply does not exist at scale in most of India.
Works on an ordinary phone	No special equipment, no lab, no trained clinician required to run the first screening. This is the single biggest reason it can reach government schools in smaller towns and villages, not just well-funded private schools in big cities.
Works without the internet	Built to function fully offline, which matters enormously in the low-connectivity regions where undiagnosed cases are most common and most neglected.
Rides an existing government mandate	SEREN is not trying to create a new market from scratch. NEP 2020 has already made this screening compulsory — SEREN only has to be the easiest, most credible way for a school or district to meet a requirement they already have.
One funnel, two revenue lines	Every school customer naturally produces individual, paying B2C customers through the parent upgrade path — most competitors would need two separate sales efforts to achieve the same thing.

9. WHY NOW

The Government Has Already Opened the Door

SEREN is not trying to convince the government or schools that this problem exists and needs to be solved — that decision has already been made. India's National Education Policy (NEP) 2020 requires schools to identify and support children with learning difficulties, and treats early screening as a national priority. This means schools and government bodies are already looking for a practical way to meet this requirement.

SEREN's entire go-to-market plan is built around this one fact: we are not creating demand from nothing, we are stepping into a requirement that already exists and offering the easiest, most affordable way to meet it.

10. WHERE WE GO FROM HERE

The Path Ahead

We are currently in Phase 2 — building the individual app. Every decision, every task, every conversation from here should be judged against one simple question: does this get us closer to a working, reliable individual app, so that we can move confidently into Phase 3, Phase 4, and eventually the district-level government rollout in Phase 5?

The opportunity in front of SEREN is not a small one. It sits at the exact meeting point of a real, widespread human problem, a government policy that already mandates a solution, and a technology that can deliver that solution at a fraction of the traditional cost. Every person joining this team is joining at the stage where that opportunity is still being built — which is exactly where the biggest difference gets made.

"Every child is a star."

— Sanskardeep Talikote, Founder, SEREN
